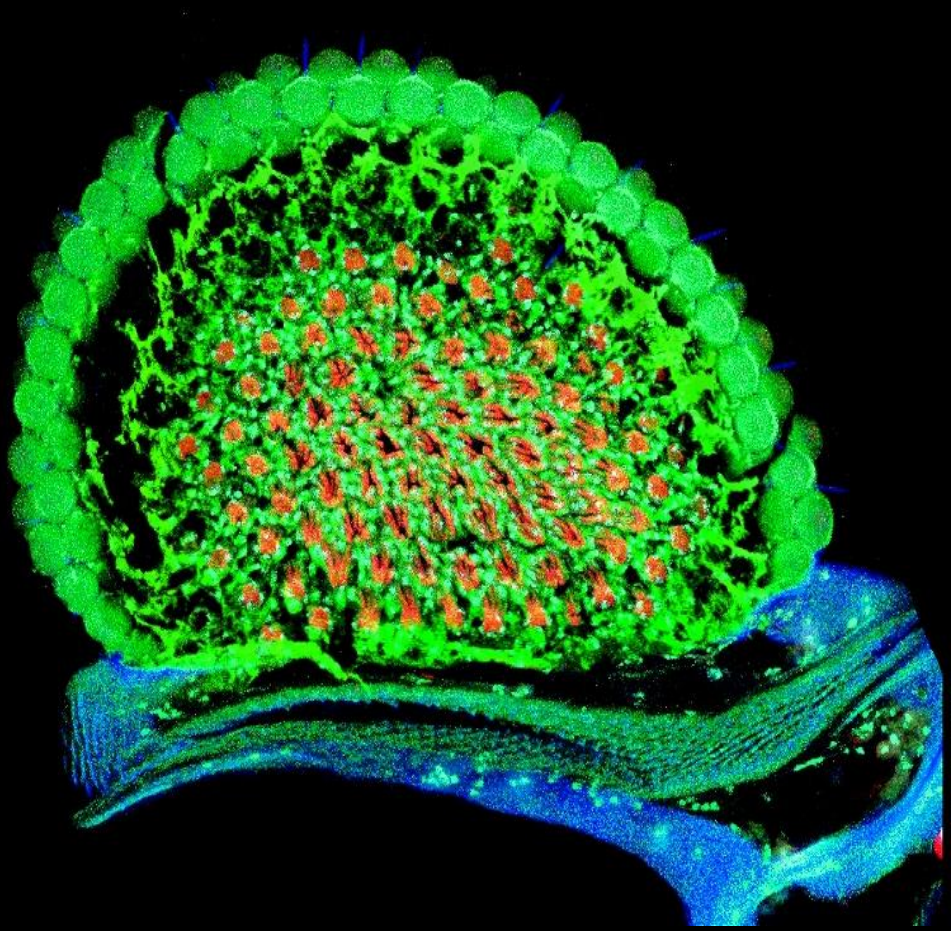
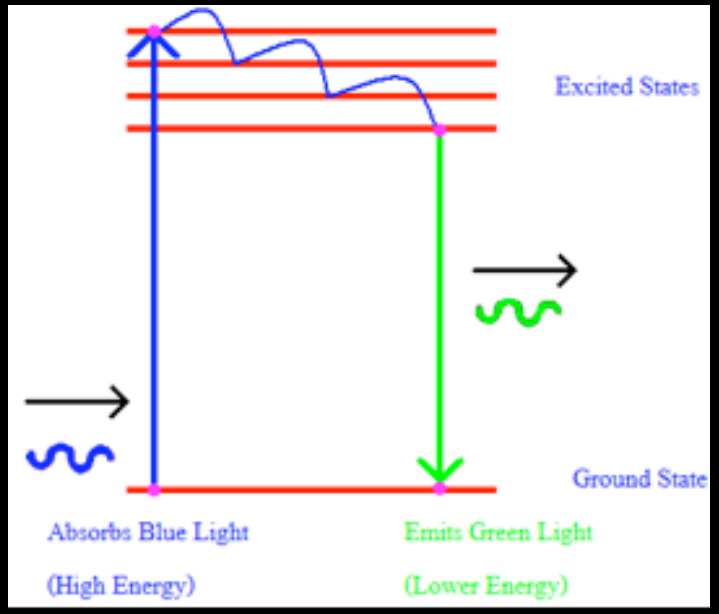
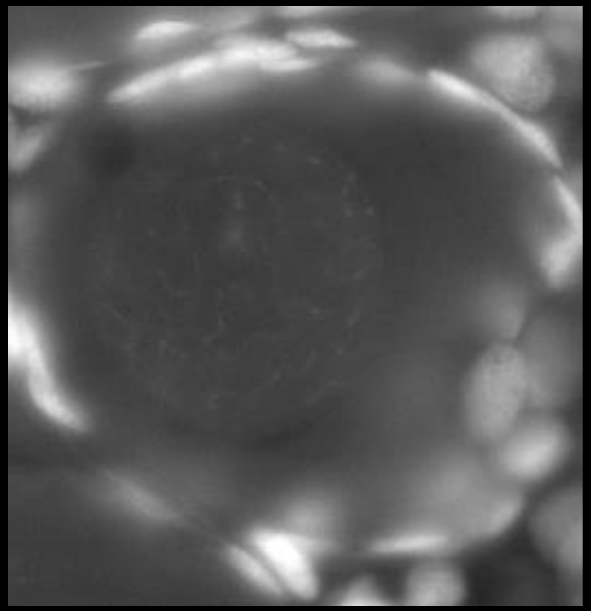
Confocal Image -- Fluorescence





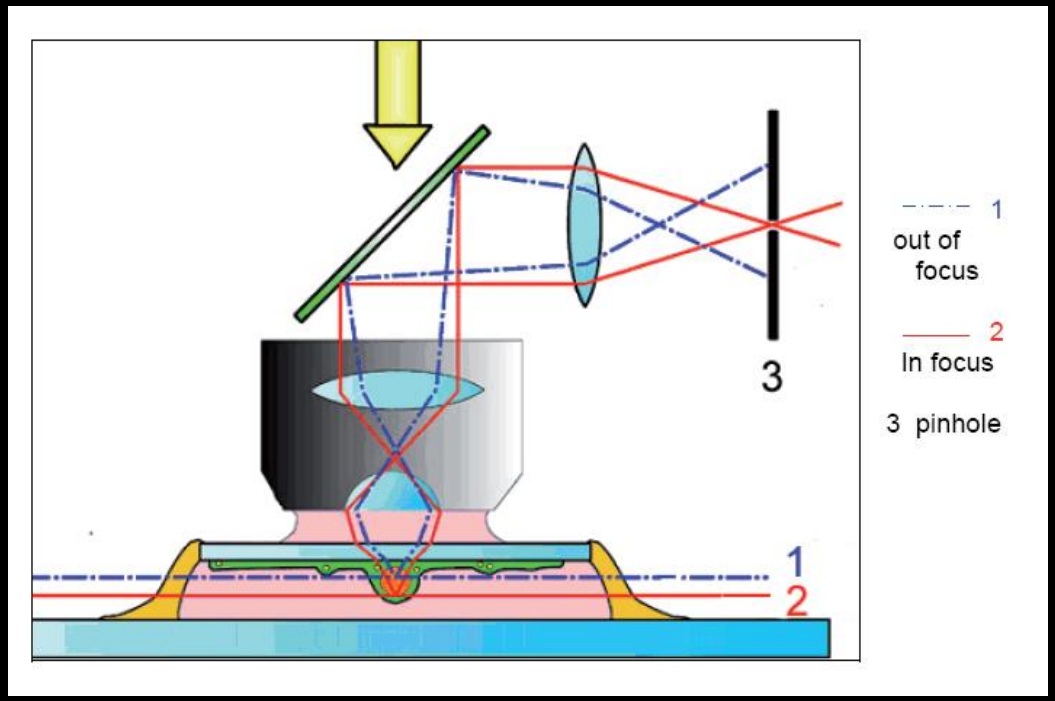
Fluorescence Microscope → Confocal System



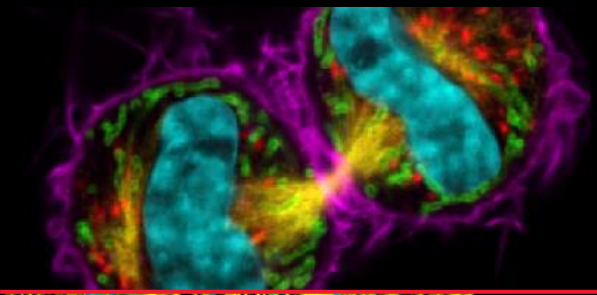
Confocal Microscopes can optically remove all information that is from outside the depth of focus.

The consequence is a sharp optical section.

Conventional Microscope → Confocal ?

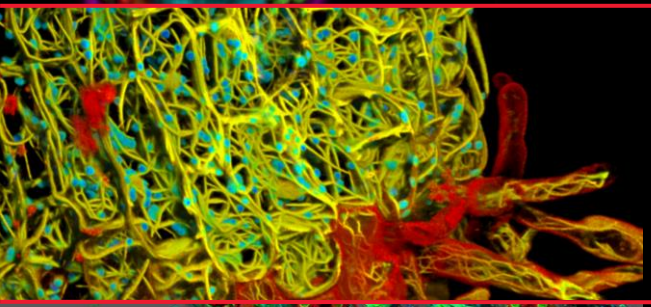


STELLARIS: Three Key Innovative Attributes



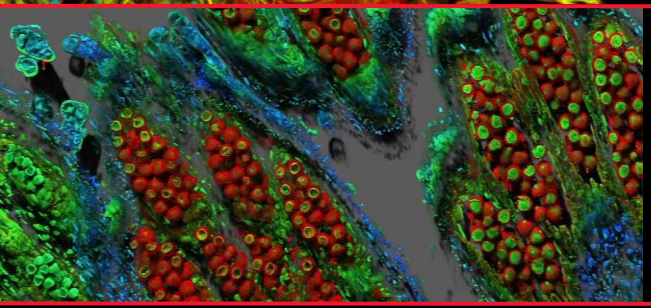
POWER

SEE MORE



POTENTIAL

DISCOVER MORE



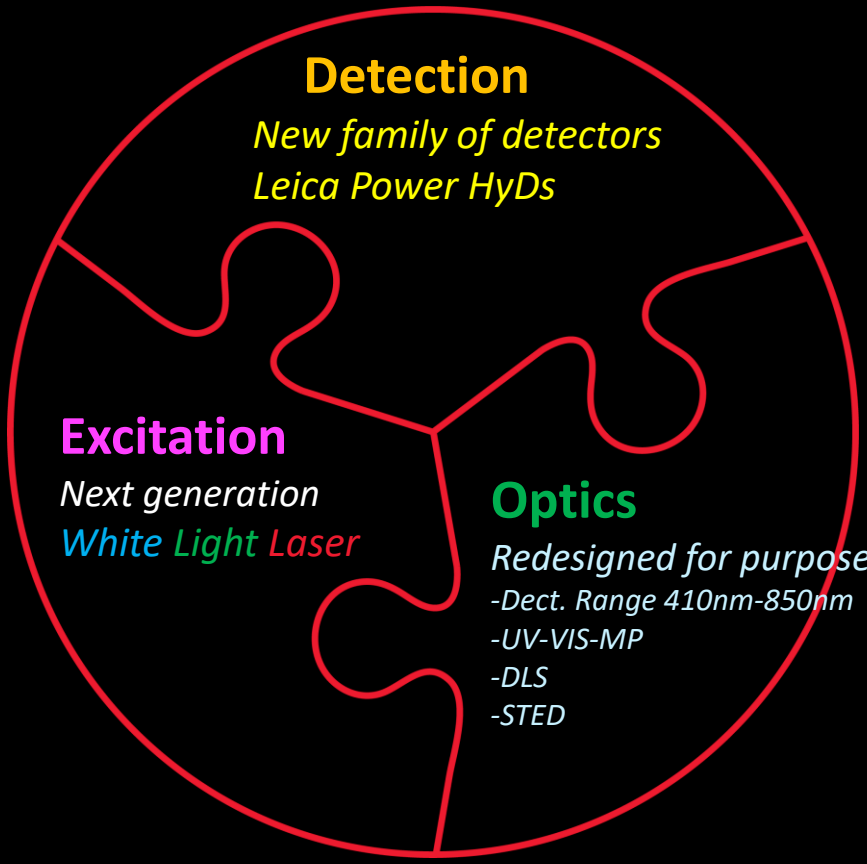
PRODUCTIVITY

DO MORE

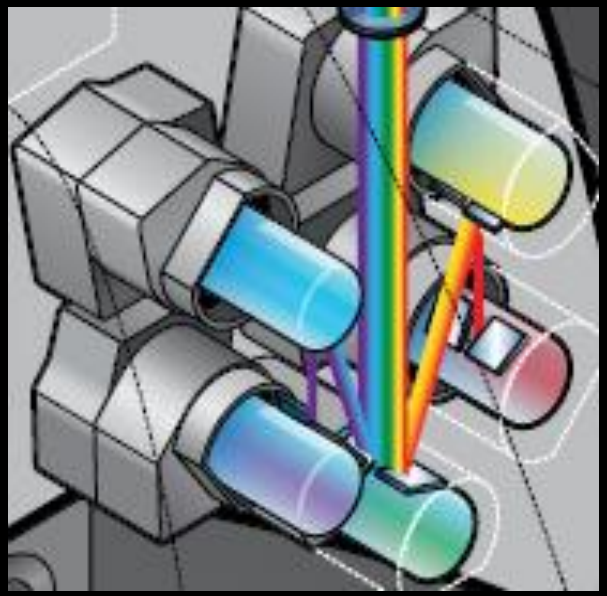
Leica

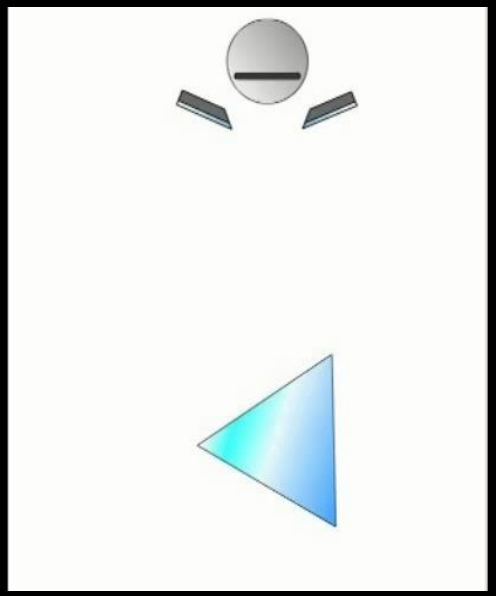
What is Power of Confocal Microscope?

Three key points:
More Sensitivities, More Flexibilities, More Modularizations



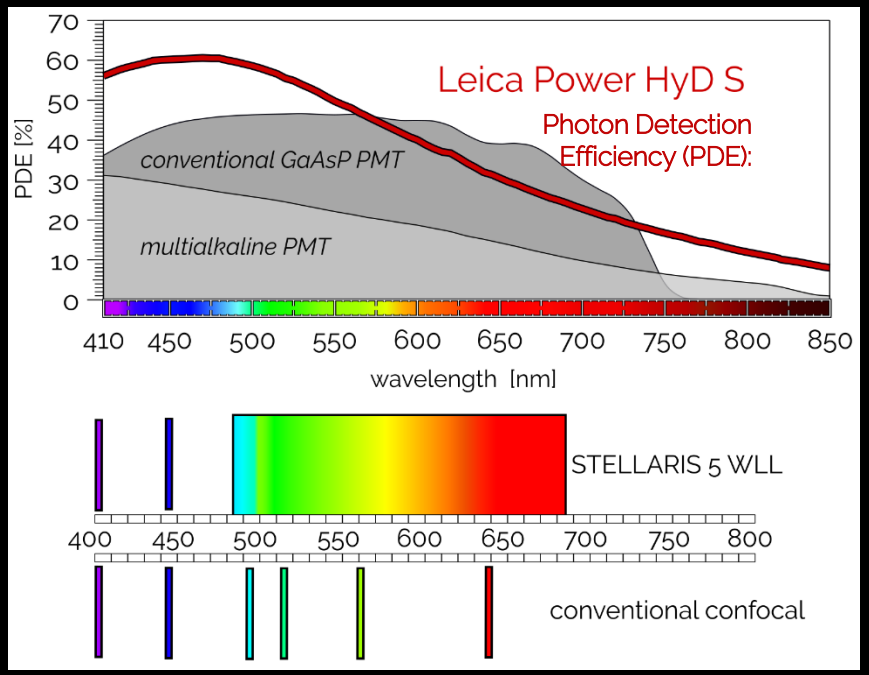
Spectral Imaging Detector -- Fit For Purpose

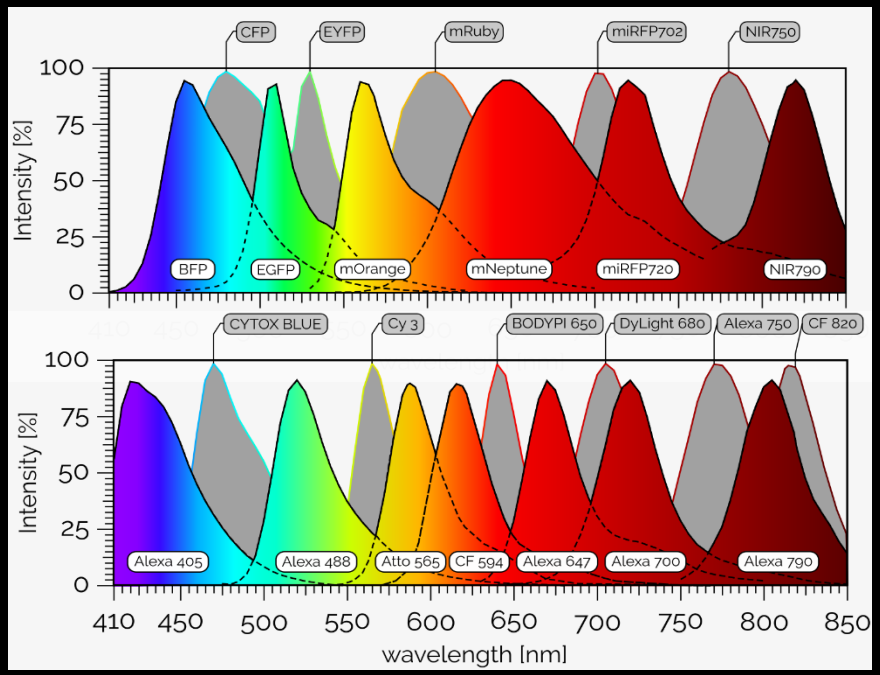




Enhanced Spectral Freedom: STELLARIS

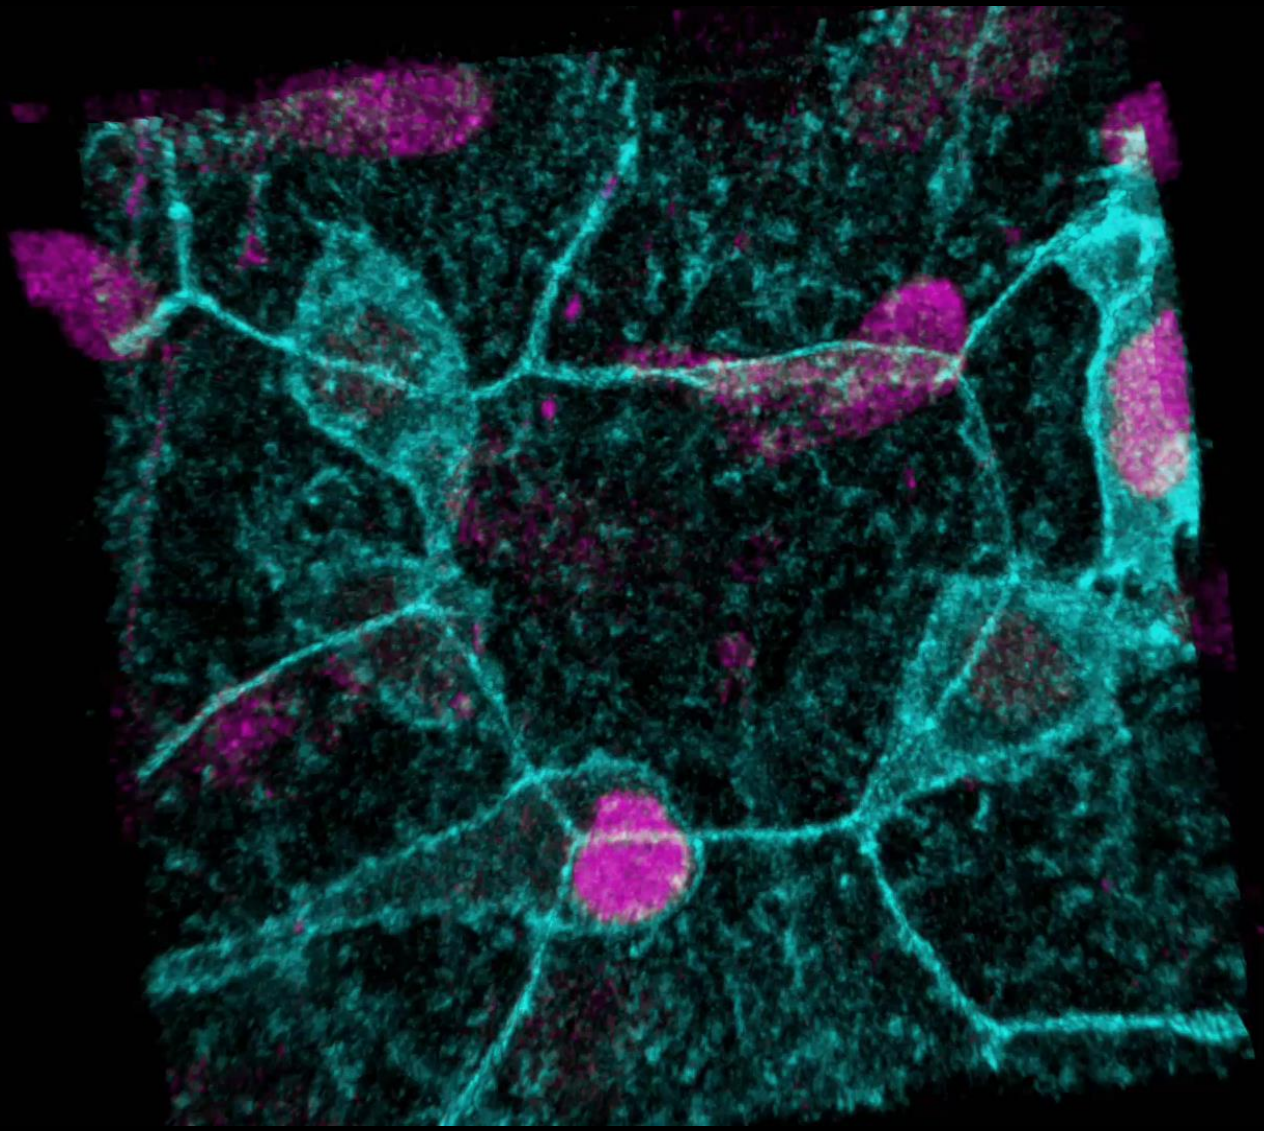
The Power HyD S Is The New All-rounder Detector For Confocal Applications





- No more PMT or GaAsP detectors
- Detection range: 410nm-------850nm
  (normal confocal: 400nm-750nm)

Gentle Live-Cell Imaging



- Perform imaging for longer periods, since both excitation as well as detection are optimally tuned
- Preserve sample integrity with efficient signal acquisition, at the lowest needed power

Leica

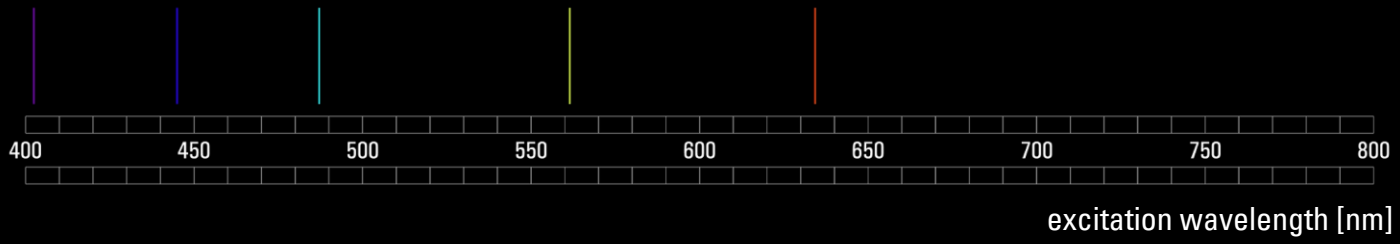
The Second Key Innovation: The next-generation White Light Lasers

Traditional Confocal

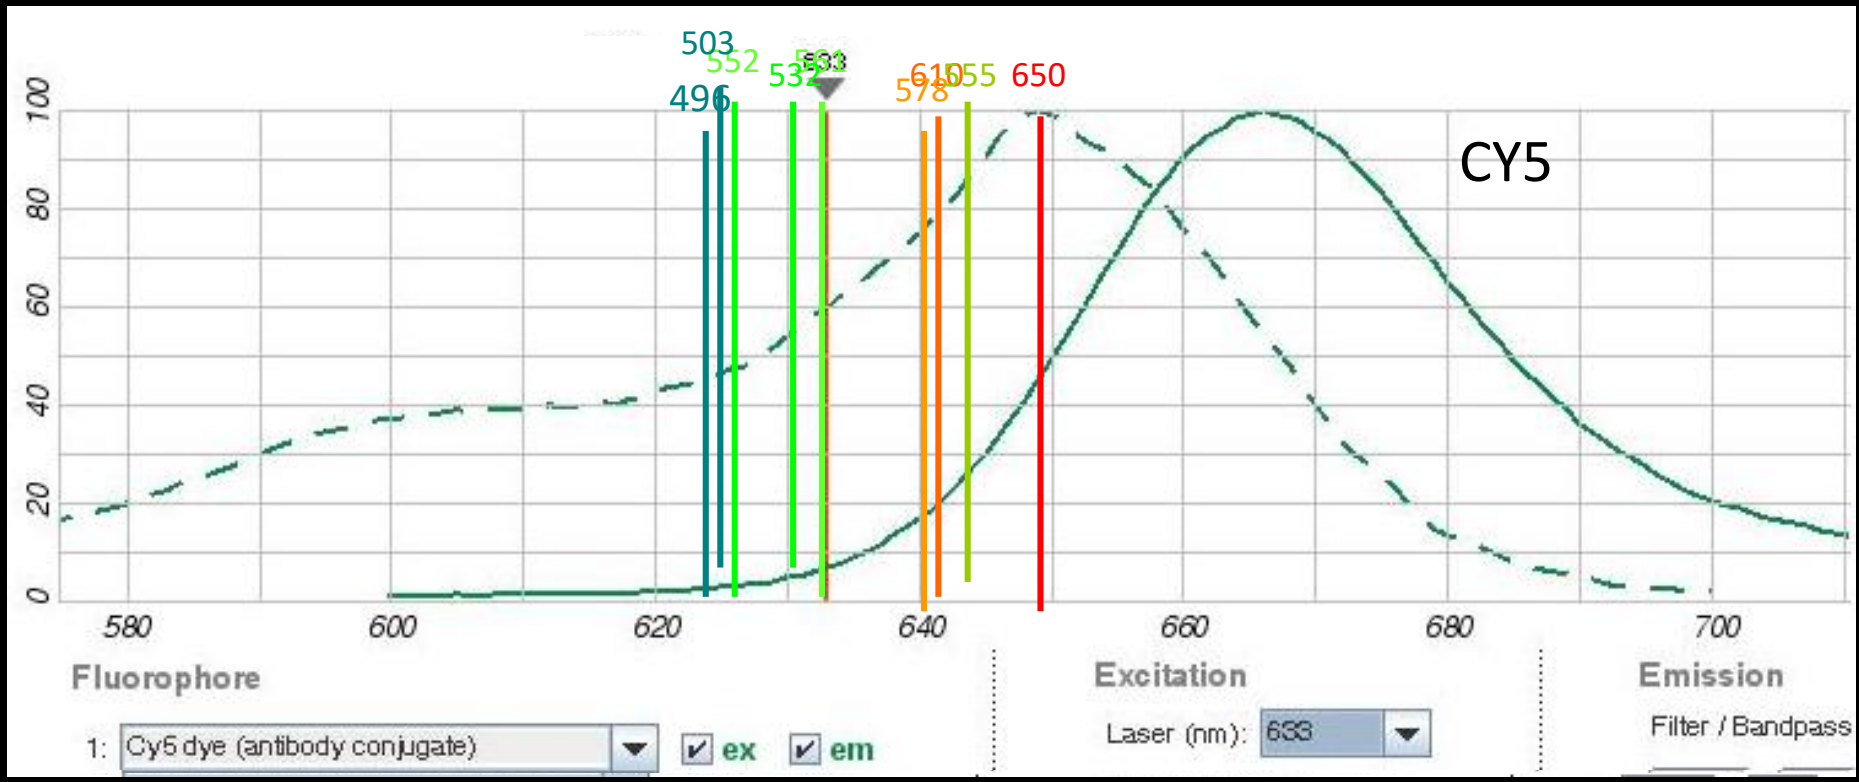


STELLARIS 8

- Experience complete spectral freedom with excitation perfectly matched to the fluorochrome
- Less complexity, more flexibility: a single laser to do the work of many. Up to 8 single excitation lines from 440 nm to 790 nm can be used simultaneously
- New optics design: detection range from 410nm to 850nm

Excitation wavelength

458nm, 476nm, 488nm, 496nm, 514nm, 543nm, 561nm, *594nm*, 633nm



LEICA STELLARIS Confocal Microscope

Excitation wavelength

440nm - 790nm, 351 ex. Lines, no limitation

The Red Extended Benefits Of Our Next Generation WLLs

- Excite each fluorophore optimally at its excitation peak
- Enhance multiplexing capabilities by adding up to 3 more fluorophores in the NIR range

Sample courtesy of Jacco van Rheenen, University of Utrecht, the Netherlands

… fluorescence contains much more information

Leica

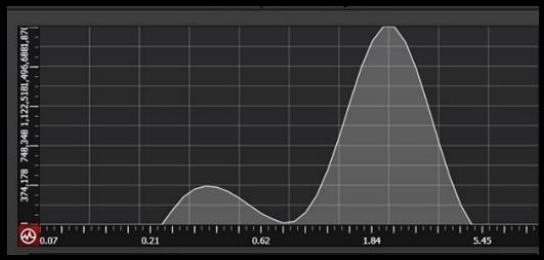
時脈頻譜(TauSense)技術的應用概念來自螢光生命週期影像技術

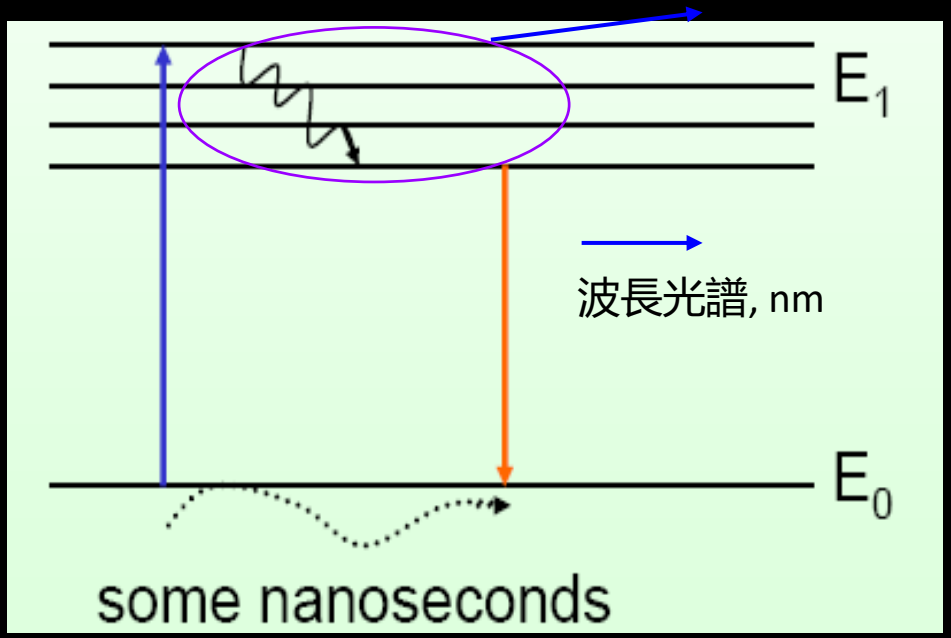
Fluorescence Lifetime Imaging Microscopy (FLIM)

Fluorescence lifetime

Average time that molecules stay in their excited state

生命週期（時脈頻譜, ns）





Fluorophore	Ex. Max.	Em. Max.
AF 488	494nm	519nm
GFP	498nm	516nm

(X)

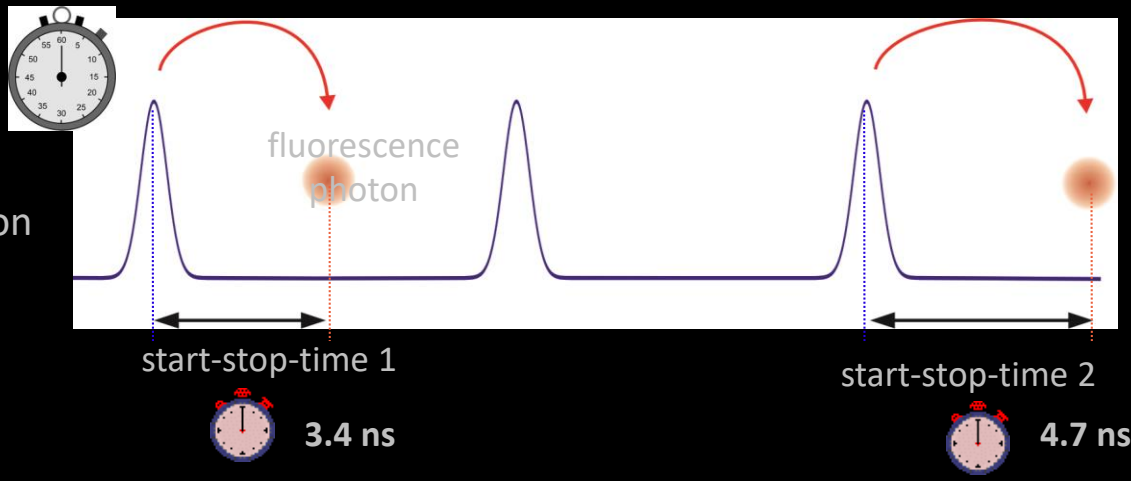
Fluorophore	Ex. Max.	Em. Max.
Fluo3 w. Ca2+	490nm	520nm
Fluo3 w/o Ca2+	490nm	520nm

How to Measure the Time?

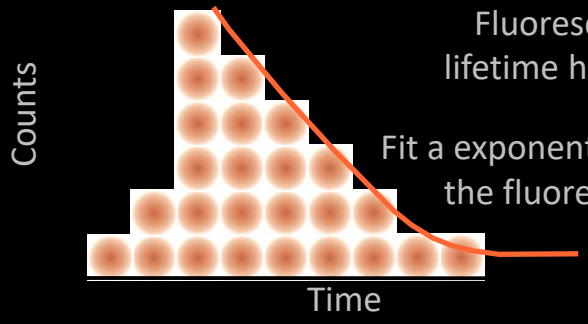
In principle with a stop watch:

1. Start the clock with a laser pulse.
2. Stop the clock with the first photon that arrives at the detector.
3. Reset the clock and wait for next start signal.

It is a statistical process!



- Repeat this time measurement very often and count "how many photons have arrived after what time"
- Sort the photons within a histogram into time bins according to their arrival times



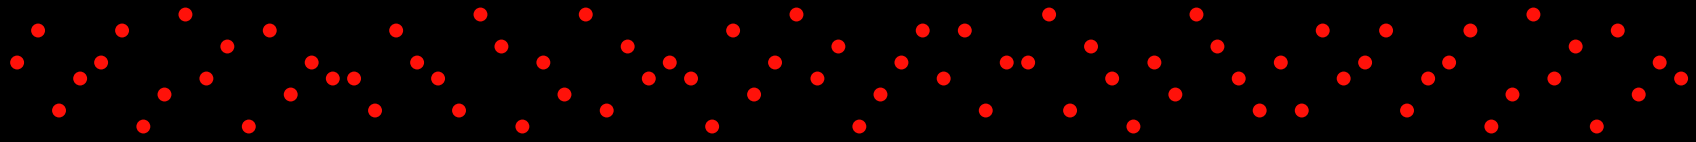
Fluorescence lifetime histogram:

Fit a exponential decay to get the fluorescence lifetime

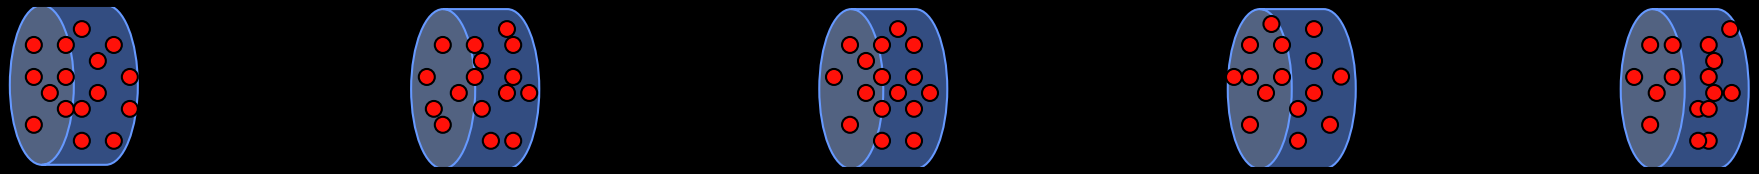
What we need for TauSense or FLIM?

- A pulsed laser

Continuous laser



Pulsed laser



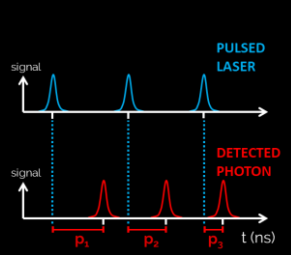
Leica STELLARIS white light laser is pulsed laser 440nm-790nm

- Photon counting detector

Normal PMT or GaAsP is not suitable for photon counting
Leica STELLARIS power HyD detectors are photon counting detectors

The Technology Behind TauSense

- Fluorescence Intensity ($N_{photons}$)
- Photon Arrival Time (ns)



1) FPGA
2) Pixel-by-pixel
3) On the fly

- Fluorescence Intensity ($N_{photons}$)
- Average Photon Arrival Times (AAT, ns)

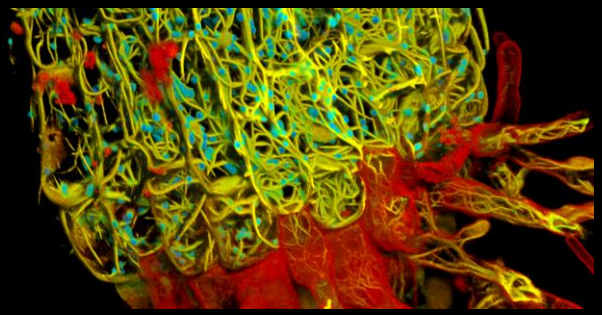
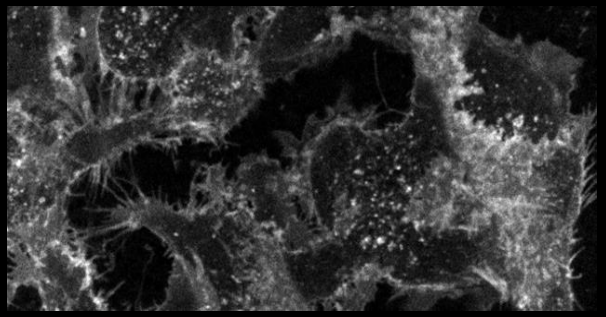
What is TauSense Good For?



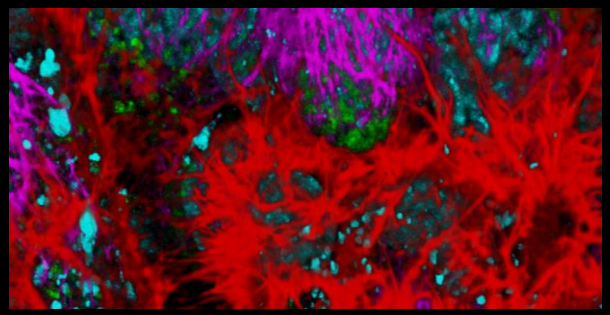
TauContrast

- Qualitative / Semi-quantitative information
- Is there a change in microenvironment? Is FRET happening?
- Changes over time (x-fold ↑↓ compared to baseline)



TauGating

- Explore sample with gates
- Remove reflections
- Remove unwanted fluorescence contributions



TauSeparation

- Separate species with different lifetimes

Traditional Confocal - intensity

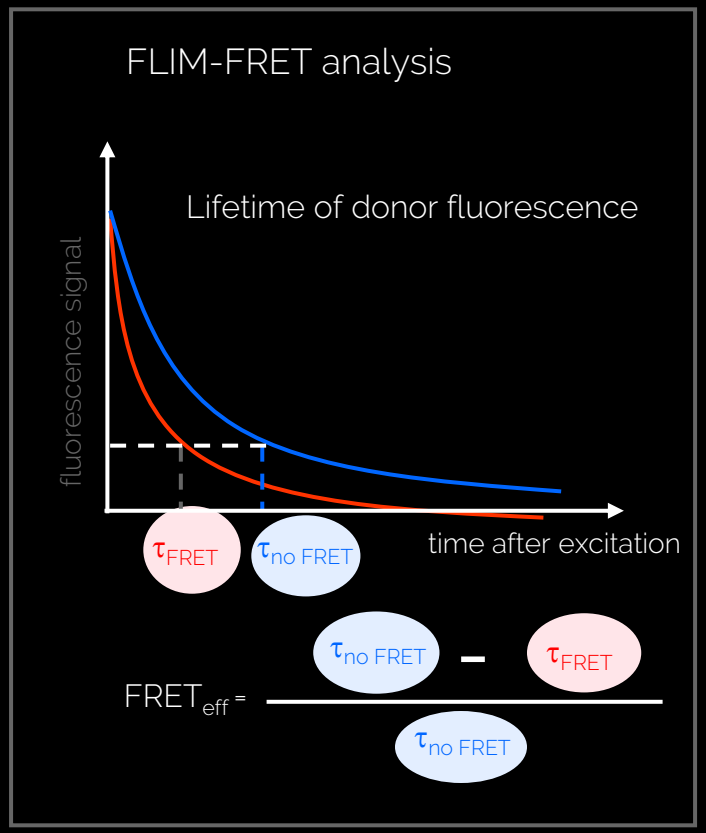
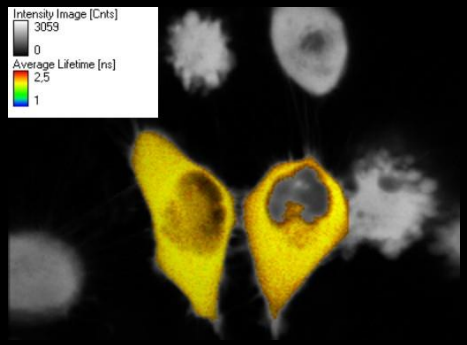
FLIM-FRET?

- **Donor lifetime shortens**

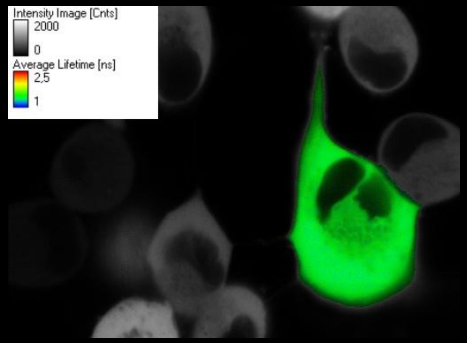
  FRET efficiency is calculated from the difference between arising fast component in donor lifetime in the presence of the acceptor and original lifetime in the absence of the acceptor



FLIM-FRET (CFP-YFP) in live cells



Donor only (CFP)



FRET pair (CFP-YFP tandem)

Donor lifetime images of FRET and control cells:

Sample: RBKB78 cells transfected with a CFP donor only or CFP-YFP fusion.

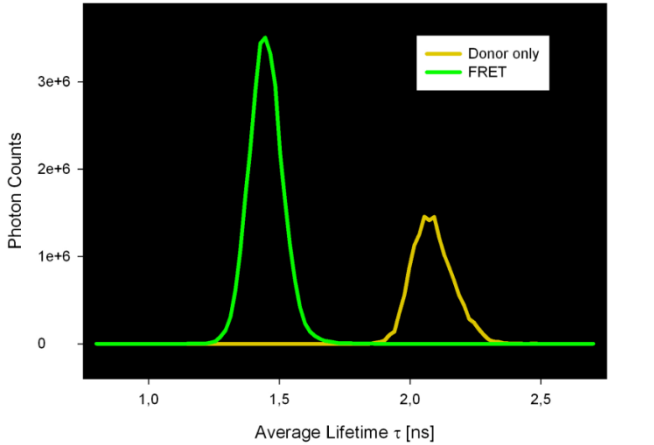
Data Acquisition: The detection band was set between 445-495 nm. Excitation @ 405 nm

Data Analysis: The coloured region has been used for analysis. Colours represent intensity modulated fluorescence lifetimes.

Result: In the presence of acceptor the donor lifetime is decreased.

Courtesy: G. Hams, University of Würzburg

FLIM-FRET (CFP-YFP) in live cells: Quantitative data analysis



Fluorescence lifetime distribution histogram of **donor only (yellow)** and **FRET (green)** samples using average lifetimes.
There is a clear shift of 0.7 ns towards shorter lifetimes in the FRET sample.

From lifetime distribution histograms one obtains:

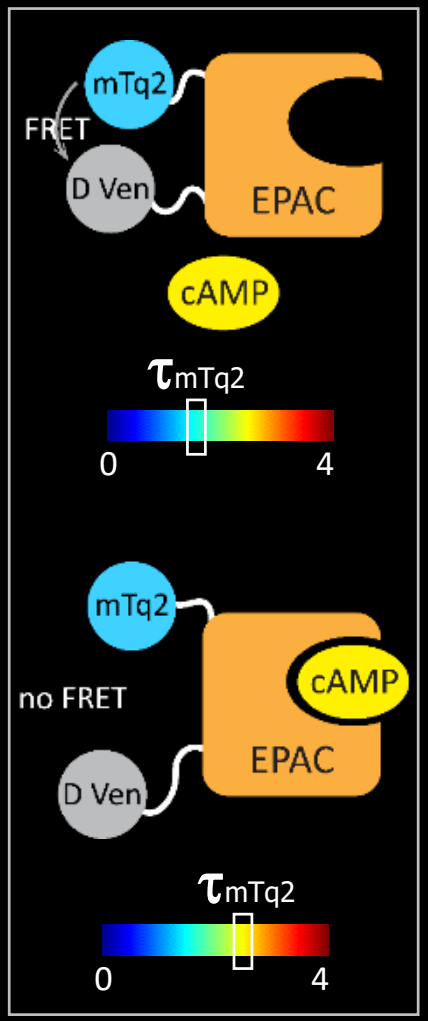
- average lifetime of the donor is: 2.1 ns.
- donor lifetime of the FRET construct is: 1.4 ns.
- FRET efficiency is: E = 30%.

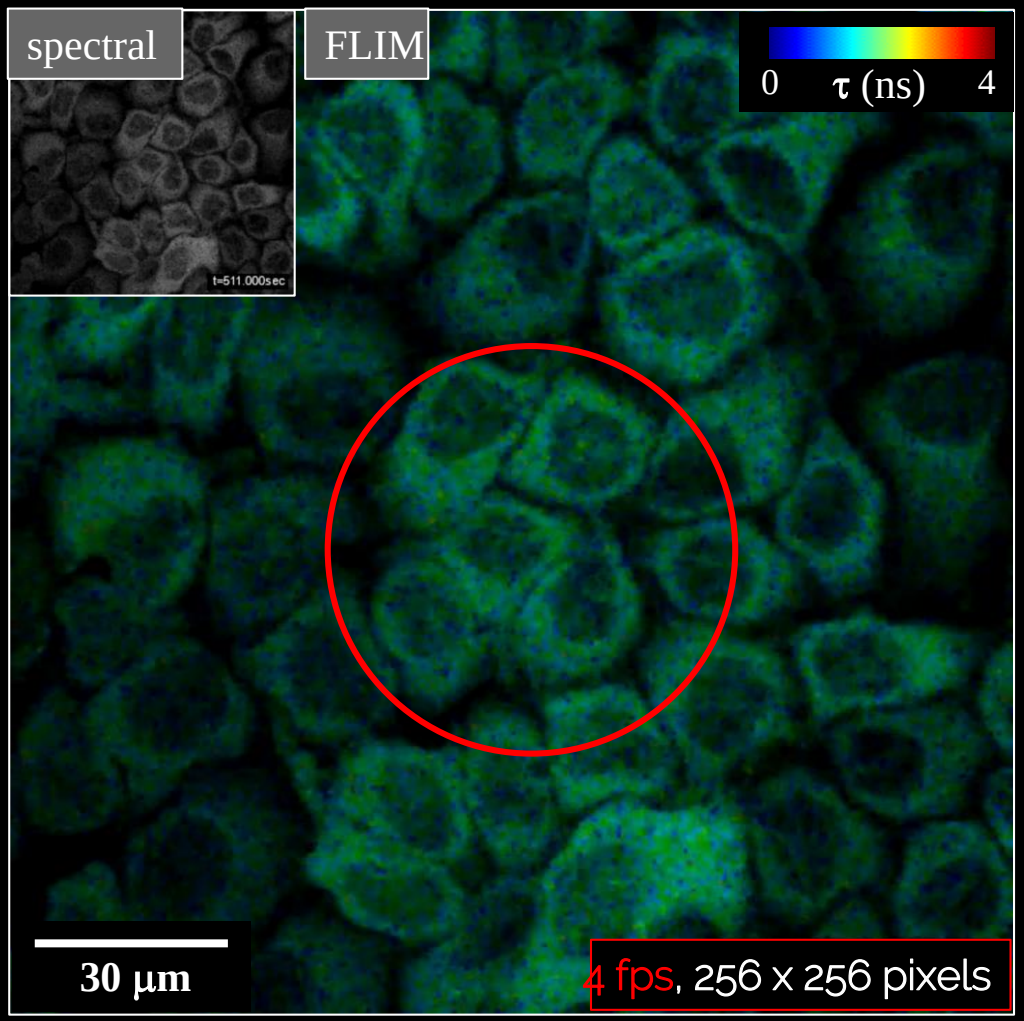
Computation of FRET Efficiency:

$$E = 1 - \frac{\tau_{quench}}{\tau}$$

Key application: Molecular interaction

cAMP signalling on-the-fly with a FLIM-FRET sensor





Caged cAMP in HeLa cells expressing EPAC mT2-dVenus FRET sensor.
EPAC response to UV-mediated cAMP uncaging.
